

Foreword

Despite the management of cardiovascular risk factors, the prevalence of heart disease continues to increase and remains the leading cause of death in the United States. Management of high risk patients are important to shift the paradigm from treatment to prevention. The role of pharmacists as interdisciplinary team members and direct patient care providers in both inpatient and outpatient settings is associated to a reduction cardiovascular risk and heart disease management.

In the issue of the Journal Di Palo. K et al report the multifaceted function and impact of clinical pharmacists on cardiovascular risk reduction and disease management.
