

# Policy Statement

Policy statements and clinical policies are the official policies of the American College of Emergency Physicians and, as such, are not subject to the same peer review process as articles appearing in the journal. Policy statements and clinical policies of ACEP do not necessarily reflect the policies and beliefs of *Annals of Emergency Medicine* and its editors.

## Reporting of Vaccine-Related Adverse Events

[Ann Emerg Med. 2019;73:e87.]

The American College of Emergency Physicians (ACEP) recognizes that vaccines effectively and significantly reduce the spread of vaccine-preventable infectious diseases, providing great substantial individual and public health benefits. Vaccines can cause minor adverse events, such as fever or localized reaction at the injection site, as well as rare yet serious adverse events such as seizure and severe allergic reaction.

ACEP acknowledges the National Childhood Vaccine Injury Act of 1986 and reporting of adverse events to the Vaccination Adverse Event Reporting System.<sup>1</sup> Reporting to the system can be completed by anyone, including

clinical providers, patients, and their families. The link below provides information on how to report. The primary purpose of the Vaccination Adverse Event Reporting System is to identify unexpected adverse events associated with the use of vaccines, allowing the Centers for Disease Control and Prevention and Food and Drug Administration to evaluate and address potential safety concerns.
